Documentation

1. Screen index

60 artboards across Foundation, Catalog, Create/Edit, Skeleton Items, Category/Brand, Import, Pricing, Bulk Pricing and Design System — numbered 01–60, split across 6 linked pages from the index for a lighter, more responsive canvas.

2. Component inventory

BackOfficeShell, Item mandatory fields · barcode reassignment algorithm · price validation thresholds · maker-checker approval for bulk pricing · exact partial-commit behavior on import · duplicate-matching algorithm · pricing validation thresholds · maker-checker approval for bulk pricing · exact permission/role matrix · country tax/MRP/rounding rules · exact keyboard shortcuts.

3. Changelog

New package. Built on the approved MiniMart POS visual DNA (navy nav, light workspace, restrained blue/teal). No POS screens were changed. Split into 6 pages after the initial single-canvas build proved too heavy to render smoothly.

4. Authority-dependent items not invented by Design

Exact skeleton-item mandatory fields · barcode reassignment algorithm · pricing validation thresholds · maker-checker approval for bulk pricing · exact partial-commit behavior on import · duplicate-matching algorithm · pricing validation thresholds · maker-checker approval for bulk pricing · exact permission/role matrix · country tax/MRP/rounding rules · exact keyboard shortcuts.

5. Open decisions preserved

All of the above are visually supported states (warnings, confirmations, authority-dependent labels) without Design choosing the underlying rule.

6. Later-phase / concept items

Store-specific price activation phasing (Phase-1 vs later) — Price Context is designed so it fits without redesign, per the current store-scoped pricing baseline.

7. Catalog vs Pricing ownership

Catalog owns product/master identity and classification. Pricing owns selling-price scheduling/history. Product Detail only displays a pricing snapshot via a link to Pricing — it is not the source of price data.

8–16. Confirmations

8. Product identity is company-wide — one Item, referenced by every store.

9. Store pricing/availability is shown as assignment context, never a duplicate product master.

10. Base, Sales and Purchase UoM remain three distinct, separately labeled roles.

11. Skeleton/incomplete items carry a distinct, always-visible Incomplete status, separate from Inactive.

12. No ordinary "Delete" action is offered for referenced products — lifecycle is Active ⇄ Inactive only.

13. Missing price is shown as "Missing", never as RM 0.00, unless an explicit authorized zero-price state exists.

14. Historical product/price changes never rewrite posted document snapshots — history views are explicitly read-only.

15. Store Node availability and Cloud Sync health are always two separate indicators, never merged.

16. No Malaysia/India-specific tax, MRP or rounding rule was hard-coded; only generic policy-extension areas are shown.

17. Responsive

Primary viewport 1366×768; screens 55–56 additionally show Products list and the product form at 1280×720. The same fluid shell also holds up at 1368×800 and 1920×1080.
